A PCR assay was developed for the detection and identification of *Candida* and *Aspergillus* species. The design of the oligonucleotide primer pair as well as the species-specific probes used for species identification was derived from a comparison of the sequences of the 18S rRNA genes of various fungal pathogens.

unencumbered by the need for additional reagents. Rapid, label-free detection methods are of great interest in medical diagnostics, biodefense and food safety. The work described in this dissertation strives to address all the aforementioned points, tied together under the common theme of detection and identification of pathogenic bacteria: 1.

chain reaction-based molecular detection methods. Result: For detection of *P. knowlesi*, blood film microscopy is not a reliable method due to the morphological similarities between *P. knowlesi* and other malaria parasites infecting human. Rapid diagnostic methods based on *P. knowlesi*-specific antibodies have not been available yet.

systems for the detection and identification of biological aerosols containing dangerous bioagents. The basic techniques used for detection and identification of bioagents are described, including physical, molecular, immunochemical, and other ligand assays. Measuring systems and equipment for the individual techniques are summarised. Keywords:
